Standard Model

https://en.wikipedia.org/wiki/Standard_Model

Technically, <u>quantum field theory</u> provides the mathematical framework for the Standard Model, in which a <u>Lagrangian</u> controls the dynamics and kinematics of the theory. Each kind of particle is described in terms of a dynamical <u>field</u> that pervades <u>space-time</u>. The construction of the Standard Model proceeds following the modern method of constructing most field theories: by first postulating a set of symmetries of the system, and then by writing down the most general <u>renormalizable</u> Lagrangian from its particle (field) content that observes these symmetries.

The global Poincaré symmetry is postulated for all relativistic quantum field theories. It consists of the familiar translational symmetry, rotational symmetry and the inertial reference frame invariance central to the theory of special relativity. The local SU(3)×SU(2)×U(1) gauge symmetry is an internal symmetry that essentially defines the Standard Model. Roughly, the three factors of the gauge symmetry give rise to the three fundamental interactions. The fields fall into different representations of the various symmetry groups of the Standard Model (see table). Upon writing the most general Lagrangian, one finds that the dynamics depends on 19 parameters, whose numerical values are established by experiment. The parameters are summarized in the table (made visible by clicking "show") above.

Struktura Modelu Standardowego

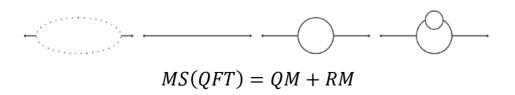

- MS jest to MODEL, a nie TEORIA.
- MS jest to efektywna teoria, w której istotną rolę odgrywają wyniki doświadczalne (np. masa elektronu, stałe sprzężenia, etc.).

Teoria strun (dla odmiany) nie potrzebuje wyników – jest wyprowadzana z czysto matematycznych przesłanek.

 MS oparty jest na teorii, w której liczba cząstek nie jest stała, ale są one nieustannie tworzone i ciągle anihilują.

tą teorią nie jest Mechanika Kwantowa, ani Relatywistyczna MK

• MS oparty jest na Kwantowej Teorii Pola (QFT).

"I still don't understand quantum theory."

Struktura Modelu Standardowego

MS jest relatywistyczną kwantową teorią pola, niezmienniczą względem lokalnej transformacji cechowania.

Symetrią MS jest grupa $SU(3)_C \otimes SU(2)_L \otimes U(1)_Y$ QCD elektrosłabe

QFT – zwiastuny

QFT czerpie z mechaniki klasycznej, mechaniki kwantowej i mechaniki relatywistycznej

- 1. Cząstka porusza się po czasoprzestrzennej trajektorii opisanej funkcją x(t), czas jest tu parametrem.
- 2. Pole to obiekt opisany funkcją $\Phi(x,t)$. Zupełnie różny od cząstek.
- 3. Ale czasem występują małe fluktuacje tego pola, i je przypiszemy powstaniu cząstek.

- QFT to teoria uwzględniająca spin, identyczność cząstek, zjawiska perturbacyjne i nieperturbacyjne.
- 5. QFT opisuje cząstki o spinie 0 (skalary), 1/2 (fermiony) oraz 1 (cząstki wektorowe bozony cechowania, czyli przenoszące oddziaływania).

Symetrie geometyczne

- Starożytni (Arystoteles, Galileo) zauważali związek symetrii z prawami fizyki:
- np. symetria pustej przestrzeni ⇒ bezwładność, odwrócenie kierunku ruchu prowadzi do takiego samego ruchu
- XIX wiek teoria grup różne własności geometryczne układów można uzyskać wykonując proste transformacje,

- Pomysł Emmy Noether związek symetrii z zachowanym ładunkiem.
- Hermann Minkowski geometryczna interpretacja STW, niezmienniczość zdarzeń w różnych układach pozostawia niezmiennik $x^2 + y^2 + z^2 (ict)^2 = const$ i podaje własności transformacji Lorentza.

$$x'^i = R^i_{\ j} x^j + a^i$$

$$d(A,B) = \sqrt{(x_B - x_A)^2 + (y_B - y_A)^2}$$
